Automatic trace analysis with Scalasca

Christian Feld
Jülich Supercomputing Centre
Automatic trace analysis

- Idea
  - Automatic search for patterns of inefficient behaviour
  - Classification of behaviour & quantification of significance

- Guaranteed to cover the entire event trace
- Quicker than manual/visual trace analysis
- Parallel replay analysis exploits available memory & processors to deliver scalability
The Scalasca project: Overview

- Project started in 2006
  - Initial funding by Helmholtz Initiative & Networking Fund
  - Many follow-up projects
- Follow-up to pioneering KOJAK project (started 1998)
  - Automatic pattern-based trace analysis
- Now joint development of
  - Jülich Supercomputing Centre

- Technische Universität Darmstadt - Laboratory for Parallel Programming
The Scalasca project: Objective

- Development of a **scalable** performance analysis toolset for most popular parallel programming paradigms
- Specifically targeting **large-scale** parallel applications
  - such as those running on K computer, IBM BlueGene or Cray systems with one million or more processes/threads
- Latest release:
  - Scalasca v2.3 coordinated with Score-P v2.0.1 (April 2016)
    - Sampling support, still experimental
    - Improved analysis report postprocessing
    - Documentation improvements
    - Various algorithmic optimizations reducing overall analysis time for traces of multi-threaded applications:
      - Improved memory management.
      - Improved trace preprocessing.
      - Improved timestamp correction.
    - Bug fixes
Scalasca 2.2 features

- Open source, New BSD license
- Fairly portable
  - IBM Blue Gene, Cray XT/XE/XK/XC, SGI Altix, Fujitsu FX10/100 & K computer, Linux clusters, Intel Xeon Phi (native MIC) ...
- Uses Score-P instrumenter & measurement libraries
  - Scalasca 2 core package focuses on trace-based analyses
  - Supports common data formats
    - Reads event traces in OTF2 format
    - Writes analysis reports in CUBE4 format
- Current limitations:
  - Unable to handle traces containing CUDA or SHMEM events, or OpenMP nested parallelism
  - PAPI/rusage metrics for trace events are ignored
Scalasca workflow

- Measurement library
- HWC
- Instr. target application
- Instrumented executable
- Instrumenter compiler / linker
- Source modules

Optimized measurement configuration
- Local event traces
- Parallel wait-state search
- Wait-state report

Summary report
- Measurement configuration

Score-P

Optimized measurement configuration
- Which problem?
- Where in the program?
- Which process?

Report manipulation
Example: Wait at NxN

- Time spent waiting in front of synchronizing collective operation until the last process reaches the operation
- Applies to: MPI_Allgather, MPI_Allgatherv, MPI_Alltoall, MPI_Reduce_scatter, MPI_Reduce_scatter_block, MPI_Allreduce
Example: Late Broadcast

- Waiting times if the destination processes of a collective 1-to-N operation enter the operation earlier than the source process (root)
- Applies to: MPI_Bcast, MPI_Scatter, MPI_Scatterv
Example: Late Sender

- Waiting time caused by a blocking receive operation posted earlier than the corresponding send
- Applies to blocking as well as non-blocking communication
Hands-on:
NPB-MZ-MPI / BT

scalasca
Scalasca command – One command for (almost) everything

```
% scalasca
Scalasca 2.3
Toolset for scalable performance analysis of large-scale parallel applications
usage: scalasca [OPTION]... ACTION <argument>...
   1. prepare application objects and executable for measurement:
      scalasca -instrument <compile-or-link-command> # skin (using scorep)
   2. run application under control of measurement system:
      scalasca -analyze <application-launch-command> # scan
   3. interactively explore measurement analysis report:
      scalasca -examine <experiment-archive|report> # square

Options:
  -c, --show-config show configuration summary and exit
  -h, --help show this help and exit
  -n, --dry-run show actions without taking them
  --quickref show quick reference guide and exit
  -v, --verbose enable verbose commentary
  -V, --version show version information and exit
```

- The `scalasca -instrument` command is deprecated and only provided for backwards compatibility with Scalasca 1.x., recommended: use Score-P instrumenter directly
Scalasca compatibility command: skin

% skin
Scalasca 2.3: application instrumenter (using Score-P instrumenter)
  -comp={all|none|...}: routines to be instrumented by compiler [default: all]
    (... custom instrumentation specification depends on compiler)
  -pdt: process source files with PDT/TAU instrumenter
  -pomp: process source files for POMP directives
  -user: enable EPIK user instrumentation API macros in source code
  -v: enable verbose commentary when instrumenting
  --*: options to pass to Score-P instrumenter

- Scalasca application instrumenter
  - Provides compatibility with Scalasca 1.x
  - **Recommended: use Score-P instrumenter directly**
Scalasca convenience command: `scan`

```%
% scan
Scalasca 2.3: measurement collection & analysis nexus
usage: scan {options} [launchcmd [launchargs]] target [targetargs]
    where {options} may include:
  -h Help: show this brief usage message and exit.
  -v Verbose: increase verbosity.
  -n Preview: show command(s) to be launched but don't execute.
  -q Quiescent: execution with neither summarization nor tracing.
  -s Summary: enable runtime summarization. [Default]
  -t Tracing: enable trace collection and analysis.
  -a Analyze: skip measurement to (re-)analyze an existing trace.
  -e expdir : Experiment archive to generate and/or analyze.
    (overrides default experiment archive title)
  -f filtfile : File specifying measurement filter.
  -l lockfile : File that blocks start of measurement.
  -m metrics : Metric specification for measurement.
```
Scalasca advanced command: scout - Scalasca automatic trace analyzer

% scout.hyb --help
SCOUT Copyright (c) 1998-2016 Forschungszentrum Juelich GmbH
Copyright (c) 2009-2014 German Research School for Simulation
Sciences GmbH

Usage: <launchcmd> scout.hyb [OPTION]... <ANCHORFILE | EPIK DIRECTORY>
Options:
--statistics Enables instance tracking and statistics [default]
--no-statistics Disables instance tracking and statistics
--critical-path Enables critical-path analysis [default]
--no-critical-path Disables critical-path analysis
--rootcause Enables root-cause analysis [default]
--no-rootcause Disables root-cause analysis
--single-pass Single-pass forward analysis only
--time-correct Enables enhanced timestamp correction
--no-time-correct Disables enhanced timestamp correction [default]
--verbose, -v Increase verbosity
--help Display this information and exit

- Provided in serial (.ser), OpenMP (.omp), MPI (.mpi) and MPI+OpenMP (.hyb) variants
Scalasca advanced command: clc_synchronize

- Scalasca trace event timestamp consistency correction

Usage: <launchcmd> clc_synchronize.hyb <ANCHORFILE | EPIK_DIRECTORY>

- Provided in MPI (.mpi) and MPI+OpenMP (.hyb) variants
- Takes as input a trace experiment archive where the events may have timestamp inconsistencies
  - e.g., multi-node measurements on systems without adequately synchronized clocks on each compute node
- Generates a new experiment archive (always called ./clc_sync) containing a trace with event timestamp inconsistencies resolved
  - e.g., suitable for detailed examination with a time-line visualizer
Scalasca convenience command: square

% square
Scalasca 2.3: analysis report explorer
     -c <none | quick | full>: Level of sanity checks for newly created reports
     -F: Force remapping of already existing reports
     -f filtfile: Use specified filter file when doing scoring
     -s: Skip display and output textual score report
     -v: Enable verbose mode
     -n: Do not include idle thread metric

- Scalasca analysis report explorer
Automatic measurement configuration

- scan configures Score-P measurement by automatically setting some environment variables and exporting them
  - e.g., experiment title, profiling/tracing mode, filter file, ...
  - Precedence order:
    - Command-line arguments
    - Environment variables already set
    - Automatically determined values
- Also, scan includes consistency checks and prevents corrupting existing experiment directories
- For tracing experiments, after trace collection completes then automatic parallel trace analysis is initiated
  - uses identical launch configuration to that used for measurement (i.e., the same allocated compute resources)
Performance Analysis Steps

- 0.0 Reference preparation for validation
- 1.0 Program instrumentation
  - 1.1 Summary measurement collection
  - 1.2 Summary analysis report examination
- 2.0 Summary experiment scoring
  - 2.1 Summary measurement collection with filtering
  - 2.2 Filtered summary analysis report examination
- 3.0 Event trace collection
  - 3.1 Event trace examination & analysis
Setup environment

- Ensure `scalasca` found on PATH
  - on login nodes for experiment examination & post-processing:

    ```
    % source /home/hpc/a2c06/lu23bud/LRZ-VIHPSTW21/tools/source-me.scorep-2.0.1.mpt.sh
    % which scalasca
    /home/hpc/a2c06/lu23bud/LRZ-VIHPSTW21/tools/scalasca/REL-2.3/intel-mpi.mpt/bin/scalasca
    ```

  - on compute nodes within jobscripts:

    ```
    # add tools to PATH
    source /home/hpc/a2c06/lu23bud/LRZ-VIHPSTW21/tools/source-me.scorep-2.0.1.mpt.sh
    # alternatively add just scalasca
    export PATH=/home/hpc/a2c06/lu23bud/LRZ-VIHPSTW21/tools/scalasca/REL-2.3/intel-mpi.mpt/bin:$PATH
    ```

- Change to directory containing NPB3.3-MZ-MPI sources
- Existing Score-P instrumented executable in bin.scorep/ directory can be reused
BT-MZ summary measurement collection...

% cd bin.scorep
% cp ../jobscript/lrz_uv2_mpt/scalasca2.mpt.sbatch.
% vi scalasca2.mpt.sbatch

[...]

export OMP_NUM_THREADS=4

Online metric description

Access online metric description via context menu
Online metric description

Late Sender Time

Description:
Refers to the time lost waiting caused by a blocking receive operation (e.g., MPI_Recv or MPI_Wait) that is posted earlier than the corresponding send operation.

If the receiving process is waiting for multiple messages to arrive (e.g., in an call to MPI_Waitall), the maximum waiting time is accounted, i.e., the waiting time due to the latest sender.

Unit:
Seconds

Diagnosis:
Try to replace MPI_Recv with a non-blocking receive MPI_Irecv that can be posted earlier, proceed concurrently with computation, and complete with a wait operation after the message is expected to have been sent. Try to post sends earlier, such that they are available when receivers need them. Note that outstanding messages (i.e., sent before the receiver is ready) will occupy internal message buffers, and that large numbers of posted receive buffers will also introduce message management overhead, therefore moderation is advisable.

Parent:
MPI Point-to-point Communication Time

Children:
Critical-path analysis

Critical-path profile shows wall-clock time impact
Critical-path analysis

Critical-path imbalance highlights inefficient parallelism.
Pattern instance statistics

Access pattern instance statistics via context menu

Click to get statistics details
Connect to Vampir trace browser

To investigate most severe pattern instances, connect to a trace browser…

…and select trace file from the experiment directory.
Show most severe pattern instances

Select “Max severity in trace browser” from context menu of call paths marked with a red frame.
Investigate most severe instance in Vampir

Vampir will automatically zoom to the worst instance in multiple steps (i.e., undo zoom provides more context)
